Demographic Profile

POPULATION AND ECONOMIC BASE

Introduction

he Demographic Profile is the second element in the work program leading to the update of the Comprehensive Plan for the Town of Union. The main purpose of this report is to describe the characteristics of the population and how that population interacts with the local economy. The Population and Economic Base section study utilizes data from statistical sources such as the United States Census Bureau.

From these sources, past and current trends can be examined and evaluated, and future projections made. The information provided here gives commercial and industrial enterprises an overview of market areas as well as the available workforce.

Study Area

The study area for this report includes the Villages of Johnson City and Endicott along with the unincorporated portion of the town (known as the Part-Town). This report also analyzes respective data in terms of neighborhoods according to Census Tract Block Groups as defined by the United States Census Bureau. These neighborhoods conform to those used in the History, Natural Features, and Existing Land Use Study. However, there is some slight overlap in the neighborhood comparison areas. As mentioned in the previous section, these neighborhoods are generally homogeneous in terms of their respective period of development, orientation, and sense of community.

2. FCONOMIC BASE

Introduction

Each urban area is characterized by a special set of assets and liabilities, and the inventory and analysis component is an indispensible and integral part of the planning process. The basic economy of any municipality is related to its land use development patterns and population trends. The economic patterns are also the result of a series of linkages between local, regional, state, and national growth

trends and market forces. For example, economic growth in the Binghamton metropolitan area resulted in additional employment opportunities, which in turn attracted an additional labor force to the area. As more industrial and commercial employees were attracted to the town, a need for further residential development arose. The resultant population growth, coupled with increased land development, expanded the town's tax base and its relative importance within the region. The Town is now the largest municipality in the county. The primary purpose of this report is to analyze in detail the economic base of the town and to establish a basis for evaluating those factors which are now influencing economic growth and are likely to significantly affect it in the future.

The economic conditions are analyzed through an examination of present and current trends within the town as evidenced by employment, retail trade, selected services, wholesale trade, and manufacturing statistics and activity. This report is divided into the following sections:

- Labor force
- Occupations
- Place of work
- Unemployment
- Industrial composition
- Commercial composition
- Commercial markets
- Income
- Population study
- Age and sex distribution
- Racial composition
- Educational attainment
- Population projections

Purpose

Most urban activities are either essentially economic in character, or have important economic ramifications. They take place on specific sites; therefore, it is the role of planners to facilitate the provision of suitable sites, of sufficient size, and at efficient locations, for the

performance of urban economic functions, while at the same time securing the noneconomic effects, such as visual aesthetics, of a successful economic base. However, the ability to create large tracts suitable for industrial development is compromised by the limiting topographical characteristics of the town and villages.

Studies of the town's economy have the underlying purpose of improving the understanding of the economy and how it works. It provides useful information necessary for understanding the economic progress, or lack of it, within the town. A principal purpose is to provide information about the local economy that will assist the community in achieving its goals and objectives. A second more technical purpose is to provide quantitative estimates of future employment and population.

SIZE OF LABOR FORCE

Introduction

The broad survey of the Town of Union's labor force provides an analysis of the human resources of the economic base of the town. The characteristics provided by the 2000 census include the rates at which males and females in the population enter the labor force, the kinds of work they do, and the chief sources of their income.

The purpose of this portion of the economic base study is to point out, in broad perspective, the changes taking place in the town's labor force because these are related to industrial development, the economic growth of the town, and the shifting patterns of production and consumption. Once identified, these changes in the labor force can be taken into consideration as they pertain to the objectives of comprehensive planning.

County-Region Comparisons

The labor force is the number of people of working age, 16 years or older, who are either working or looking for work. Table 1 shows that the overall size of Broome County's labor force has declined during the past decade by a little over 9,000 people, which amounts to a decrease of 5.37 percent. The City of Binghamton suffered the most of this loss, with a reduction of 5,239 people, equivalent to approximately 57.8 percent of the labor force losses across the entire County. On the other hand, the Town of Union accounted for a little over 30.8 percent of the lost labor force. The Town of Vestal posted a minor gain in this area, showing an increase of 20 people over the past decade. Even though this gain is minimal, Vestal has been able to avoid the losses that have occurred elsewhere in Broome County.

Table 1 ~ Size Of Labor Force, Broome County And Selected Municipalities 1990-2000

| Census 2000 | | Broome | County | | | City Of Bir | nghamtoi | 1 | | Town O | f Vestal | | | Town O | f Union | |

Town-Village Comparisons

As shown in Table 2, the Village of Johnson City saw the largest decline in available labor force with a loss of 1,245 people, or 8.89 percent, while the Part-Town's labor force decreased by only 4.57 percent. The Village of Endicott, on the other hand, had the smallest loss of labor with a decline of only 4.46 percent, or 491 people, between 1990 and 2000.

Table 2 ~ Size Of Labor Force, Town Of Union, 1990-2000

Labor Force, By Sex

A tendency toward a larger proportion of females in the labor force is evident in the urbanized census tracts, a trend that began in the 1960s and has increased over the years. Increase in female employment may be related to the following factors:

1. The female population, on the whole, became more career oriented due to increased educational attainment.

- 2. The female population is either not having children, or having them at an older age.
- 3. Increased economic pressures make it necessary for families and/or households to seek supplemental income.
- 4. With an older population, it is possible that children may have left the household, making it possible for more women to work.

County-Region Comparisons

As shown in Table 3, there has been a general decrease in the size of the labor force across the entire Broome County area, with the exception of the female population in Vestal, which saw a small increase between 1990 and 2000. The rate at which males and females in the labor force have declined over the last decade has been quite comparable. In the Town of Union, the percentage of males and females remained at 46.7 and 53.3 percent respectively in both 1990 and 2000. In Binghamton, there has been a decrease in females over males by more than 1,000 people. Vestal saw an increase of 230 females entering the work force, and at the same time 210 males left the labor pool.

Town-Village comparisons

Table 4 shows that the Part-Town area had a moderate decrease of 617 persons or 5.6 percent in the number of males in the labor force. Over the same period of time the number of females in the labor force decreased by 440 or 3.6 percent. The ratio of males to females in the labor force remained almost unchanged with only a .5 percent difference between the numbers in 1990 and 2000. The Part-Town area showed below average losses compared to the entire Town of Union area.

The Village of Endicott experienced a loss of 176 males, or 3.5 percent, and a loss of 315 females, or 5.3 percent, from the labor force between 1990 and 2000. The proportion of males to females remained virtually unchanged with an increase of just .48 percent in the labor force.

The biggest losses to the labor force in the Town of Union came from the Village of Johnson City. Johnson City lost 622 male workers and 623 female workers or 9.6 and 8.2 percent respectively.

4. OCCUPATIONS

Introduction

This section of the Demographic Profile deals with the occupational structure of the regional and the town labor force. The occupational structure is an important indicator of the educational and income level of the residents of an area. The occupational structure also reflects the industrial and commercial mix and the ability of the local labor pool to adapt to jobs created by incoming and expanding industrial and commercial developments. The occupational structure and the changes over time are vital information to commercial enterprises and the housing industry. This information enables businesses within these sectors to define and redefine their consumer markets. An increase in the number of people in professional occupations and a corresponding decline in production occupations would reflect a higher income structure and a growing demand for luxury goods and services. As stated above, the occupational structure of the labor pool is important in attracting additional industries to the area, since a prerequisite of industrial location is the existence of a qualified labor force in the area in which they plan to locate.

There are six general categories that cover a range of professions as reported by the United States Census Bureau:

Note: The sequence in which these occupations appear is not intended to imply that any group has a higher social or skill level than another.

Management, Professional, and Related Occupations Include:

- Business and Financial Operations Specialists
- Computer Technicians and Developers
- Architects and Engineers
- Drafters, Cartographers and Mapping Technicians,
- Legal Social Services
- Education Positions
- Health Care Practitioners and Technicians

Service Occupations Include:

- Healthcare Support Occupations
- Fire Fighters, Police Officers
- Building and Grounds Maintenance Operations
- Personal Care and Service Occupations

Sales and Office Occupations Include:

- Sales Occupations
- Office and Support Occupations
- Realtors

Farming, Fishing, and Forestry

Construction, Extraction, and Maintenance Occupations Include:

- Construction and Extraction Workers and Supervisors
- Installation Maintenance and Repair Occupations

Production, Transportation, and Material Moving Occupations Include:

- Production Occupations
- Aircraft and Traffic Control Occupations
- Motor Vehicle Operators
- Material Moving Workers

County - Region Comparisons

As shown in Table 6, the Town of Union enjoys the largest percentage of Management, Professional and Related Occupations, the largest percentage of Sales and Office Occupations, the largest percentage of Construction and Maintenance Occupations as well as the largest percentage of Production and Transportation Occupations. Only the city of Binghamton has more people employed in Service Occupations.

Table 6 ~ Occupational Categories, Broome County And Selected Municipalities, 1990 and 2000

| TOTAL | 98,783 | | 91,340 | | 22,940 | | 19,911 | | 12,625 | | 11,390 | | 28,983 | | 26,933 | |

Tables 7 and 8 show that like much of Broome County, the Town of Union experienced losses of Management and Professional Occupations throughout the 1990s. Of the 2,871 Management and Professional jobs lost across Broome County between 1990 and 2000, 1,799, or 62.7 percent of those were from the Town of Union. Overall the Town of Union experienced a larger than average loss of people in Management and Professional Related Occupations, with the Broome County average being 8.3 percent and the losses in the Town of Union being around 16 percent of the total labor force.

There was a slight overall gain in Service Occupations between 1990 and 2000 in Broome County. While the City of Binghamton saw losses in Service Occupations, the Towns of Union and Vestal both saw gains in employment, even if they were a modest 23 more jobs in Vestal and 41 more in Union.

The Town of Union was below average in the number of jobs lost in Sales and Office Occupations. While there was a loss of 1,144 jobs across Broome County, the Town of Union lost only 11 positions, while the Town of Vestal lost over 615.

All across Broome County the shift away from Agricultural, Fishing, and Forestry Occupations that began in the 1960s continued. The largest loss of jobs in Broome County occurred in the Agricultural section of this category. Over 71 percent, or 663 jobs, were lost between 1990 and 2000. Binghamton, Vestal, and Endicott were above average in the percentage of Agricultural jobs lost with decreases of 86, 77, and 84 percent respectively.

Town-Village Comparisons

Even with all the job losses in Broome County during the period of 1990 to 2000, parts of the Town of Union were able to make gains in labor. As indicated in Tables 9 and 10, the Village of Johnson City saw an increase of 175 Service Occupation jobs, a gain of over 13.6 percent. The Part-Town area gained 288 Sales and Office jobs, an increase of 7.5 percent. The Part-Town area also saw an increase of 16.8 percent, or 125 jobs in Construction and Maintenance as well. Between 1990 and 2000, both the Part-Town and the Village of Endicott saw gains in Production, Material Moving, and Transportation Occupations as well, with a gain of 84 jobs, approximately 5.3 percent in the Part-Town, and a gain of 23 positions in the village of Endicott.

The biggest losses came in the Management and Professional Occupations. Overall, the Town of Union lost 1,799 jobs. The Part-Town area experienced the greatest loss in this job sector. Of the 1,799 positions lost, 1,325 (almost 74 percent) were from the Part-Town area. Overall, the Part-Town area saw a decrease of almost 20% from 1990 to 2000. The Village of Endicott witnessed a loss of 290 jobs, which amounts to a decrease of 15 percent. The Village of Johnson City experienced the smallest loss in this category, with only a 7.2 percent decrease, or 184 jobs.

Construction, Extraction, and Maintenance Occupations decreased by 1.25 percent, which amounted to a loss of 22 jobs overall, but the overall change in Construction, Extraction, and Maintenance jobs was felt differently in different sections of the Town. The Part-Town area actually saw an increase of 125 positions, or a 16.8 percent gain, while the Villages of Endicott and Johnson City both experienced job losses. Endicott saw the loss of 126 positions, a decrease of 27.2 percent, while Johnson City declined by 22 jobs, or roughly 4 percent.

A slight overall gain was achieved in Production, Transportation, and Material Moving Occupations. 87 jobs, or 2.25 percent, were added between 1990 and 2000. The Part-Town area posted a gain of 84 jobs, while the Village of Endicott gained 23. Over the same period, the Village of Johnson City lost 20 jobs.

As illustrated in Table 11, a redistribution of the labor force throughout the Town of Union took place. There was a shift away from Management, Professional, and Related Occupations. In 2000, this category of workers included a smaller percentage of the overall workforce than in 1990. As such, each of the other classes of workers increased their percentage of the workforce. The percentage of Service, Sales and Office, Construction, Extraction, and Maintenance, and Production and Transportation all saw increases in their portion of the overall labor force in the Town of Union.

As far as the various parts of the town are concerned, the Part-Town area was most affected by this loss of Management, Professional, and Related occupations. Instead, the Part-Town made large gains in Sales and Office Occupations.

Neighborhood Comparisons

This section deals with the occupational breakdown of the labor force by neighborhood for 2000.

As shown in Table 13, North Endwell, North Endwell West, North Endwell East, Fairmont Park, and Oakdale/Reynolds have a significantly higher proportion of professional and managerial workers than the Town of Union as a whole. As expected, these areas have the newest and highest priced housing, thereby attracting the most affluent segment of the working force, the professional and managerial workers.

Most of the blue-collar workers, i.e. Construction, Maintenance, Production, and Transportation Occupations, lived in Westover, West Corners, North Endicott, Union Center, West Endicott, and the remaining part of the town. These areas generally are older in terms of age of the housing structures and of the residents. With the exception of West Corners, they are also closer, in terms of physical distance, to the manufacturing and commercial establishments in the villages, Binghamton, and along the industrial belt in the Part-Town area.

Interestingly enough, the neighborhoods with the highest proportion of females in the labor force were not necessarily the neighborhoods that had the highest number of Sales and Office or Service Occupations. The neighborhoods of Roundtop, Central West Endicott, North

Endwell West, Southside Johnson City, and Northside Johnson City all had female participation in the work force of over 55 percent; however, only one of those neighborhoods was in the top 5 for the percentage of Sales and Office Occupations.

Neighborhoods in Johnson City including Southside, Central, Northside, and Floral Park showed an above average number of workers that were employed in Service Occupations.

Classes of Employed Workers

The class of employed workers indicates the relative strength of the local job market. As shown in Table 14, the category "government employees", although still a relatively small segment of the total employed workers, is the fastest growing segment. Government workers include people who are employees of any federal, state, or local governmental unit, regardless of the activity of the particular agency. In 1990, government employees accounted for 13.7 percent of the employed workers, while in 2000, government employees accounted for 15.4 percent, an increase of 2.5 percent.

Self-employed workers include people who work for profit in their own unincorporated business, professional practice, trade, or who operate a farm. Self employed workers in the town declined by 103 workers or 7.5 percent during the 1990s. This decline can be tied to the decline of farming and agricultural jobs in the area.

Unpaid family workers are defined as people who work 15 hours or more without pay in a business or on a farm operated by a relative. The gains in this area seem to be counterintuitive to the losses in the farming industry. A reasonable explanation may be the increased need for family type day care in which children are supervised in the home instead of in an established professional day care company. Extra family help could be considered to fall within this category.

5. PLACE OF WORK

Introduction

The purpose of this chapter is to analyze the past and present trends pertaining to place of work as related to place of residence. Place of work is an important variable directly related to the economic vitality of an area. It is desirable that development be varied enough to provide substantial employment opportunities as well as residential opportunities. Since well-planned industrial and commercial uses provide tax benefits to the town that residential uses alone cannot provide, a coordinated employment-residence pattern is therefore indicative of a well-balanced tax base and community.

A Metropolitan Statistical Area (MSA) is a region that has been officially defined by the federal Office of Management and Budget for use by federal statistical agencies, and is based on the concept of a core area with a large population nucleus plus adjacent communities that have a high degree of economic and social interaction with that core.

The MSA for the City of Binghamton includes both Broome and Tioga Counties.

The data provided by the census, unfortunately, does not detail where in the county, other than in the Central City, Binghamton, the employment centers are located. Based on knowledge of the employment structure of the county, it is safe to assume that the Town of Union has the greatest opportunity for employment with secondary focus areas in Vestal, Conklin, and Kirkwood.

Town-Village Comparisons

As demonstrated in Table 15, the most significant shift in the place of work patterns is a shift away from the town's reliance on the City of Binghamton for employment opportunities. Between 1990 and 2000 the number of people living in the Town of Union and working in the in City of Binghamton dropped nearly two percent. Most of this change came from the Village of Johnson City, which also had the highest percentage of its population working in Binghamton in the first place, probably due to the easy access and short travel times from Johnson City to Binghamton.

Although there was a decrease in population from 1990 to 2000 across the municipalities, Johnson City showed an increase of 200 people working inside the MSA, but outside of Binghamton, indicating that people in Johnson City were able to find opportunities for work within the Town, rather than having to work outside the MSA or move away to find employment. Since Johnson City saw an increase of 13.5 percent of their population working in Service Occupations between 1990 and 2000, these residents who previously had been working in Binghamton due to locale, were probably able to find jobs close to their homes, most likely in Endicott or Vestal.

There were only very slight changes in the percentage of people that lived within the Town of Union and worked outside the MSA. Most notable are the residents in the Part-Town area that work outside any MSA. Since a little over seventy percent of the residents in the Part-Town area are employed in Management, Professional, & Related Occupations and Sales and Office Occupations, it is assumed that these people are traveling to areas outside the community to perform their jobs.

| United States | Worked in MSA/PMSA of Residence | | | | | | | Worked Outside MSA/PMSA of Residence | | | | | | | | | | | | |

| Town of Union | 5,820 | 20.4 | 4,943 | 18.6 | 22,024 | 77.1 | 20,768 | 78.3 | 260 | 0.9 | 156 | 0.6 | 170 | 0.6 | 196 | 0.7 | 295 | 1.0 | 452 | 1.7 |
| Village of Endicott | 1,189 | 17.1 | 1,072 | 17.1 | 5,527 | 79.6 | 5,038 | 80.2 | 79 | 1.1 | 74 | 1.2 | 28 | 0.4 | 31 | 0.5 | 122 | 1.8 | 65 | 1.0 |
| Part-Town | 2,254 | 16.6 | 2,077 | 16.4 | 11,038 | 81.4 | 10,088 | 79.8 | 109 | 0.8 | 66 | 0.5 | 75 | 0.6 | 107 | 0.8 | 85 | 0.6 | 298 | 2.4 |
| Village of Johnson City | 2,377 | 29.5 | 1,794 | 23.6 | 5,459 | 67.7 | 5,642 | 74.2 | 72 | 0.9 | 16 | 0.2 | 67 | 0.8 | 58 | 0.8 | 88 | 1.1 | 89 | 1.2 |

Neighborhood Comparisons

An examination of Table 16 reveals that there were only a few neighborhoods in the Town of Union that saw a significant change in the percentage of their residents working within the City Binghamton between 1990 and 2000.

The neighborhoods of Roundtop, North Endicott, Northside West Endicott, and Central West Endicott all saw an increase in the percentage of their residents that worked within the City of Binghamton.

Even though these neighborhoods saw a decrease in population between 1990 and 2000, the increase in the percentage of residents that worked in the City of Binghamton was due to an actual increase in the number of people working in the City and not to attrition of residents working outside the City. Most of the residents in these neighborhoods hold jobs in Management, Professional & Related Occupations, or Sales and Office Occupations.

The neighborhoods of West Endicott, Oakdale/Reynolds, Southside Johnson City, Floral Park, Northside Johnson City, and Choconut Center saw a decline in the percentage of their residents that worked in the City of Binghamton between 1990 and 2000.

The residents in these neighborhoods trend towards Service Occupations and Sales and Office Occupations, and to a lesser degree Management, Professional and Related Occupations. The exception to this being the neighborhoods of Oakdale/Reynolds and Choconut Center, which both had high percentage of residents working in Management, Professional and Related Occupations. Choconut saw the largest drop in percentage of residents working in the City. Between 1990 and 2000 Choconut dropped by a little over ten percent of its

population. Choconut also does have one of the smaller populations in the Town of Union, so this ten percent drop corresponds to a decrease of only thirty jobs in those ten years.

6. UNEMPLOYMENT

The level and rate of unemployment have long been used as summary indicators of economic conditions. Relatively easy to understand, unemployment statistics have become a barometer by which to gauge the need for designing and implementing labor policies and programs. These programs are of two sorts: those which seek to improve general economic conditions, thereby increasing the demand for labor; and those that seek to directly reduce unemployment, usually focusing on improving the characteristics of the labor supply.

The Town of Union's unemployment is related to structural and technological factors in the labor market. Structural factors are those changes in occupational mix, product changes or labor force composition. Technological factors are those in which unemployment is caused by changes in the production function or redundant skills not readily reabsorbed by the firm in production.

From looking at table 17 we can see that from 2000 thru 2006 the Town of Union has had a lower unemployment rate than both the County and the State. The residents of the Town of Union are more employable on average than the rest of the County and the State as a whole. This reflects the wide array of job skills possessed by the residents of Union, which allows them to find employment throughout Broome County.

Table 17 ~ Town of Union, Broome County, New York State Unemployment Rates 2000-2006

7. INDUSTRIAL COMPOSITION

Introduction

Industrial activity, like commercial activity, is characterized by its concentration on a limited land area. Since industrial activities, unlike residential land use, require locations with specialized characteristics, and since industrial land uses require a much more extensive area than commercial uses, the designation of areas for industrial development is the earliest tangible step in the preparation of a comprehensive land use plan for an urban area such as the Town of Union.

The Town's industrial structure has been undergoing a rapid transition since the beginning of World War II. The industrial composition has shifted from its former dependence on manufacturing leather goods, furniture, processing of foods, and other industries that relied primarily on less skilled workers towards electronics, precision metals, and other industry sectors, requiring more skilled labor. This change is still in progress and will be hastened by the growth of the area's educational facilities, namely the Watson School of Engineering at SUNY Binghamton and various technical programs at Broome Community College.

The town has gone through major shifts in the last thirty-five years. First was a period of rising employment in electronics and associated industries, and the second was steadily declining employment in the leather and related industries. The skills of the older leather products workers were seldom transferable to the production needs of the new and growing electronics firms. The people with the older skills had to learn new skills and find new places of employment. Now with the reduction in the reliance on manufacturing skills, the residents of the Town must once again adapt and learn new skills in order to compete in the new job market that is centered around commercial operations and smaller, less management heavy manufacturing firms.

Industrial Location

Industrial concerns have three basic locational requirements:

- 1.) Large, fairly level sites served by public utilities;
- 2.) Accessibility to major transportation routes; and
- 3.) Accessibility to the labor pool.

These three requirements have resulted in a limited number of sites in the Town of Union. Only the southern portion of the town offers all three amenities.

In hilly southern New York, including the Town of Union, the critical factor hinges on the availability of tracts that are large enough and level enough to accommodate industrial activities. A large number of modern industries, due to the continuous material flow design or automatic features, must have a single story plant that is literally "wrapped around" the production line. The need for extensive parking and loading areas also creates demand for more space.

In the town, large level areas are predominately located in the southern part of the town. Although there are a few locations in the northern portion of the town, these sites do not have adequate utilities for industrial uses. There is not very much available, suitable land in the southern portion of the town. The suitable land has been developed in residential uses, which preclude industrial use, except through the costly accumulation of small residential properties. The remaining vacant land has other topographic problems related to them, namely most are prone to flooding.

Historically the railroads were the major transportation link needed by industrial concerns. The railroad routes and spur lines were established in the southern portion of the town. The emphasis has shifted since the 1940s to truck transportation and the need for direct highway access. The major highway in the area is Route 17, which passes through only a small section of the eastern portion of the Part-Town area and Johnson City. Other areas in the county, such as the county industrial park in Kirkwood located at the juncture of Route 17 and Interstate 81, offer easier accessibility.

Due to the hilly nature of the town, the north-south access routes are hampered by the steepness of the grade of these roads. The only access roads in the town that offer good accessibility are generally located south of Watson Boulevard and include Watson Boulevard, Main Street (17C), North Street, and Glendale Drive. The western portion of the town, because of the location of the Tri-Cities Airport, offers an additional form of transportation, although air transport has not been fully developed. Transportation facilities by air (including the county airport) are thought by some businesses to be inadequate in that connecting flights are fairly inconvenient.

Endicott Interconnect Technologies

Endicott Interconnect Technologies provides engineering and manufactured products for applications found in Defense and Aerospace, Medical and Advanced Test Equipment, Semiconductor, Server and Telecommunications systems. The company currently employs over 1,400 employees.

The company specializes in prototype and medium volume production quantities. Some of their products include semiconductor packaging, printed circuit boards and precision equipment while also maintaining services such as technical service design, modeling, simulation and testing services, which include physical, mechanical, chemical, and environmental services.

Amphenol

Amphenol, formerly Bendix, one of the largest manufacturers of interconnect products in the world for the Military, Commercial Aerospace, and Industrial markets, is based in Sydney, NY.

The Amphenol division in Endwell designs, manufactures and markets cylindrical and rectangular, electronic, fiber optic, EMI/EMP filter, and a variety of special applications connectors and interconnect systems for a broad range of engineered cable assemblies and custom sub-system for multi-national OEM's in the Infocom infrastructure markets and Industrial and Automotive markets.

BAE Systems

BAE Systems Inc., formerly BAE Systems North America, is a major subsidiary of the UK-based defence and aerospace company BAE Systems plc. It operates as a semi-autonomous business unit within BAE Systems controlled at a local level by American management.

The BAE Systems facility, formerly General Electric, has been in Westover since 1949. The local plant develops and produces aircraft control and avionics equipment for military and commercial aviation. It also provides hybrid electric drive systems used by New York Transit and other urban transit fleets across North America. More than 800 New York City buses use the company's hybrid drive trains.

Recently Governor Eliot Spitzer and Empire State Development/Upstate Chairman Daniel Gundersen announced that BAE Systems will expand its Westover operations, preserving more than 1,300 existing jobs and creating 125 new positions.

IBM

Since 1906, when Harlow Bundy first moved his growing manufacturing enterprise (then called International Time Recording Company) from Binghamton to Endicott, IBM has had a major impact on the industry in the Town of Union. Even after much of what was IBM in its heyday has left the Town, IBM Endicott still operates as a diverse location for more than ten IBM organizations with over 1,600 employees on-site.

The following groups have a major presence at IBM Endicott:

- IBM Banks Manufacturing;
- IBM eServer Development;
- IBM E&TS (Engineering & Technology Services);
- IBM Global Asset Recovery;
- IBM Global General Procurement;
- IBM Global Services;
- IBM Real Estate Site Operations (RESO); and
- IBM Printing Systems Division

The Printing System Division manufactures IBM printing systems which provide solutions that go beyond the printer page.

8. COMMERCIAL COMPOSITION

Introduction

Commercial land use refers to the use of land for activities involving trade, administration, and record keeping, the so-called tertiary and quaternary activities. Tertiary activities are those involved with the performance of services or the transfer of ownership of goods, including wholesale and retail trade. The villages and the Part-Town area have a wide variety of tertiary activities and as with other towns, cities, etc.; such activities constitute the major portion of the economic base. Quaternary activities involve the servicing or repair of various goods. They are less widespread than the tertiary activities, but perform a needed service. The location, extent, and pattern of commercial activities, as expressed in the pattern of commercial land use, are of great importance to urban planners.

The numbers, relative sizes, and spacing among "central places" are functions of the nature of the population served, including its density, demographic and occupational structure, and its income, as well as of the transportation pattern, which provide accessibility between the various establishments and their respective service areas. These variables, and the patterns that are associated with them, constitute one of the most generally accepted concepts in comprehensive planning. In broad terms, the categories presented are wholesale, retail, and service activities. Wholesaling is the least important commercial activity in the town. Generally, the land requirements for wholesale establishments in the town are decreasing, because of improvements in transportation and changes in marketing, including an increase in the number of chain stores and centralized purchasing, which combine to reduce the need for extensive inventories.

Patterns of concentration exist in the location of retail and service establishments. In general, the more specialized the goods and services, the less widespread the establishments dispensing them, and the greater the tendency for them to be concentrated in the more urban villages where they are accessible to a larger population, hence a larger and more extensive market.

The Town of Union has a "nested hierarchy" of central places, or clusters of establishments, each with its own trade or service area. Each successively higher central place in the hierarchy tends to include within it, the functions and establishments that serve more extensive areas and populations. On the other hand, the appearance of lower order commercial uses in the central business district is indicative of its decline. In order for lower order commercial uses to appear in the central business district, demand must have fallen significantly. Johnson City's downtown area, to some extent, has seen this occur. The prominent commercial uses are convenience stores, which account for a large part of the total commercial entities. Strip commercial development is evident along the major transportation routes such as Route 17C, Harry L. Drive, Watson Blvd. and elsewhere to a lesser degree. These and other types of commercial uses will be discussed later in this section.

COMMERCIAL MARKETS

Introduction

This chapter of the economic base study will analyze the market areas of the various commercial uses in terms of their location relative to the eleven neighborhoods of the Part-Town area. In the planning process, it is necessary to consider various aspects of land use, so that residents are assured of a wide choice of facilities and services, including commercial facilities and services.

The commercial areas of the villages were considered only in terms of their effect on the adjacent areas of the Part-Town. The majority of the Part-Town residents are within a 2.5-mile radius of the villages' central business districts, where a wide variety of both convenience and other forms of commercial uses are found.

This analysis will primarily deal with concentrations of convenience stores and their respective market areas. In order to be considered a convenience store concentration, at least one food store plus two of the other types of convenience stores must be located in close proximity to each other. The groupings range from convenience commercial areas, the smallest concentration, to regional shopping areas, the largest concentration. Many of the newer commercial areas are in the form of shopping centers while the older concentrations are in the form of strip development along an arterial.

This analysis will also consider other selected commercial uses such as auto related stores, furniture and appliance stores, restaurants, department stores, medical offices, legal offices, and building supply stores, as to their locations relative to each neighborhood.

This study assumes that people will travel to the nearest commercial use, although in reality, people have preferences that are not based on proximity. This study used locational standards as presented in Planning Design Criteria by Koeppelman and DeChiara. The following is the breakdown of the commercial groupings and the locational standards of each:

1. Regional Shopping Areas

Regional shopping areas have as their anchors at least one major department store along with other stores such as: furniture and appliance stores, restaurants, banks, clothing stores, and various professional services. The regional shopping areas are: Binghamton's central business district, the central business district of Endicott-Washington Avenue, the central business district of Johnson City - Main

Street, Vestal Parkway, and the Oakdale Mall. Since all residents of the town are within 2.5 miles of one of these areas, the regional shopping areas were not delineated on the market area map of the town. Furthermore, since none of the regional areas are in the Part-Town area they will not be discussed in this chapter. The regional centers in the villages are indicated on the market area map.

2. Community Shopping Areas

These areas have the second largest service area that encompasses most of the town, with the exception of the northern corners of the Part-Town area. There is considerable overlap of the community shopping areas' market areas, especially in Endicott. The market area for the Union District and Endicott Plaza completely overlap Endicott and the adjacent portions of the Part-Town area. This type of commercial area is a large collection and variety of stores with an anchor of at least one junior department store and a supermarket. The community shopping areas also contain other convenience commercial uses, similar to those provided in the regional centers although at a smaller scale with less variety. The community shopping areas are as follows: Park Manor Plaza, Endicott Plaza, and River Plaza. These areas are also shopping centers, built as a single planned unit, having large parking areas, and under single ownership.

3. Neighborhood Shopping Areas

The neighborhood shopping areas are collections of stores, sometimes developed as a single unit, but considerably smaller than the community shopping areas. The anchor for the neighborhood shopping area is the supermarket and its accompanying convenience stores, such as drug stores, banks, restaurants, service stations, clothing stores, laundry and cleaning stores, and often beauty and barber shops. The following have been categorized as neighborhood shopping areas: West Corners Plaza, North Street and Mechanic Avenue, Country Club Plaza, Endwell Plaza, and Riverside Drive Plaza. With the exception of North Street and Mechanic Avenue, the other neighborhood shopping areas are shopping centers, although Country Club Plaza was not originally developed as a single planned unit.

4. Convenience Shopping Area

The convenience shopping areas are the smallest commercial areas in terms of both the market area and the number and variety of stores. They consist of a grocery store and at least two other convenience stores, such as drug stores, barber and beauty shops, etc. This type of commercial area is found in most abundance in the villages. The Village of Endicott, especially, has an abundance of convenience shopping areas sprinkled through the northern and western portions of the village. The convenience shopping areas are as follows:

❖ Watson Blvd., from Avenue B to Kelly Avenue,

- Oak Hill Avenue and Pine Street.
- ❖ Watson Blvd., from North McKinley Avenue to Odell Avenue,
- North Page Avenue, from Jennings Street to Maple Street,
- North Nanticoke Avenue and West Wendell Street.
- North Street and Liberty Avenue,
- ❖ Harry L. Drive and North Baldwin Street,
- ❖ Harry L. Drive, from Albany Avenue to Myrtle Avenue,
- ❖ Main Street and Carhart Avenue and Floral Avenue, from Ackley Avenue to Massachusetts Avenue.

The following are locational standards for these above mentioned respective categories and the population to be served by the various categories. The radiuses for community shopping areas are shown on Map 2 as two miles, as well as 1/2 of a mile and 1/4 of a mile. Neighborhood commercial areas were computed for 1/2 of a mile and 1/4 of a mile radius. Convenience shopping areas were restricted to 1/4 of a mile radius. A 1/2 of a mile radius was considered to be a short driving distance, while the 1/4 of a mile radius was assumed to be walking distance. The radius of a regional shopping area is 20 miles, therefore the entire town is served, although most of the regional shopping areas are well within the 20 mile radius.

Table 18 ~ Commercial Facilities Standards

| Category | Typical Location | Radius Of Service Area | Minimum Population Required |
|--------------|----------------------------|------------------------|-----------------------------|
| | | | To Support |
| Regional | Interstate Highways | 20+ Miles | 30,000 |
| Community | Intersection Of Arterials | 2 Miles | 30,000 |
| Neighborhood | Intersection Of Collectors | ½ Mile | 4,000 |
| Convenience | Local | ¼ Mile | 2,000 |

Community Shopping Areas

The three community shopping areas, Park Manor Plaza, River Plaza, and Endicott Plaza cover the major portion of the Part-Town by their two-mile radii. The only areas not within the two-mile radii of a community shopping area are Choconut Center and the northwestern portion of the town, west of Union Center. In terms of variety of stores, both Park Manor Plaza and River Plaza are quite limited. Park

Manor Plaza has a supermarket, a drug store and several smaller stores. River Plaza is limited to a "big box" home improvement center, a take-out restaurant, and an Off Track Betting (OTB) office. There is room in the plaza for additional pad site development. River Plaza's proximity to the Oakdale Mall poses a problem for the smaller plaza.

As stated previously, Endicott Plaza and the Union District completely overlap in terms of market area. Endicott Plaza is the larger center containing a discount department store (K-Mart). A number of smaller stores within the plaza have been demolished. The Union District has a large quantity and variety of small convenience stores and several professional and financial offices. The market area for Park Manor Plaza, in terms of a 1/2 mile radius is North Endwell and a portion of Hilltop. River Plaza serves Westover and a segment of Johnson City. Endicott Plaza and the Union District serve West Endicott. All three shopping areas are accessible for pedestrians, although the heavy vehicular traffic on Hooper Road limits pedestrian movement.

Neighborhood Shopping Areas

The neighborhood shopping areas are more scattered than the community shopping areas and therefore serve a greater number of neighborhoods. In the Part-Town area, Country Club Plaza serves the Endwell and Hilltop areas, Endwell Plaza serves the Hooper neighborhood and a small portion of Endwell and West Corners Plaza serves West Corners.

Although there are several convenience shopping areas in the Part-Town, their market areas overlap the neighborhood centers. There are several areas that are currently unserved with shopping facilities other than regional and community areas. These areas are Pineview-Nanticoke Valley, Taft Heights in North Endwell, the Hillside Terrace area, Union Center, Choconut Center, North Endicott, the western portion of Endwell, Fairmont Park, the extreme western portion of West Endicott, and the southwestern and northwestern portions of the town.

North Endicott, Pineview-Nanticoke Valley, and the upper Taft Avenue area have enough population to support small neighborhood shopping areas. The need for such areas should become greater as these areas continue to develop.

Commercial Facilities and Services By Neighborhood

The following sections will detail the distances to commercial centers and other selected commercial uses.

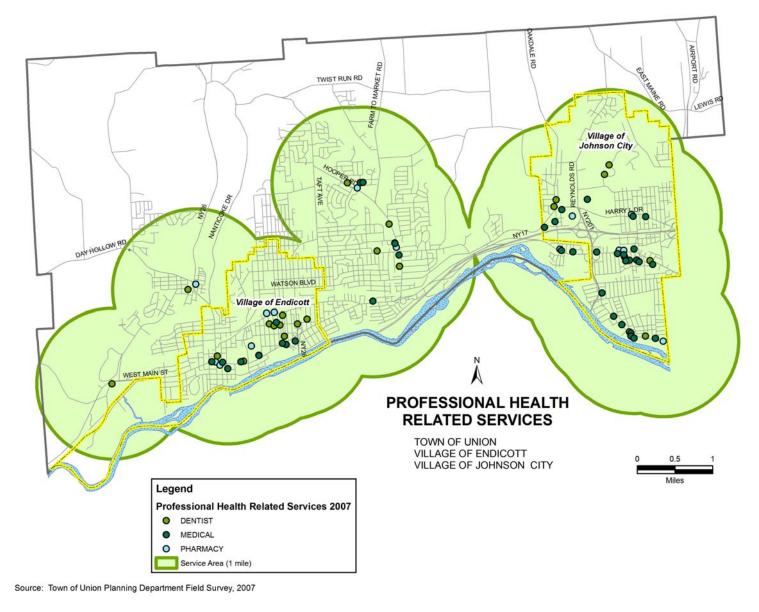

It appears that most needed services are easily accessible. Some services are closer in the Village of Endicott, thus reducing travel.

Table 159 ~ Approximate Distance To Commercial Facilities and Services By Neighborhood

| | Grocery Stores | Auto Related Goods/Services (Gas Stations, Auto Parts, New & Used Car Sales) | Fast Food & Other Restaurants | Department Stores | Professional Health Related Services (Medical, Dental, Pharmacies) | Home Goods, Furniture, Appliance & Building Supplies |
|------------------------------|-------------------------|--|-------------------------------------|----------------------|--|---|
| Neighborhood | | | Approximate Dis | stance (Miles) | | |

10. INCOME

Introduction

Personal income data provides a useful comparison of economic conditions among areas in the Town of Union. The data reflects the basic difference in standards of living, although some serious limitations are present when comparisons are made between urbanized and non-urbanized areas. Housing costs in a suburban area may be higher for housing of a similar quality than in an urban area. Despite the shortcomings of the measurement, it does indicate trends and comparisons, which are significant in understanding and planning for the Town of Union.

County Region Comparison

As shown in Table 20 the county and selected municipalities had a decided shift in the income structure of their residents. The median income for the county increased by \$9,598 or 26.8 percent, from \$35,824 in 1990 to \$45,422 in 2000. There was a marked decrease in the number of families with income less than \$25,000, a drop of almost 20%, or 6,819 families. In comparison to the rest of the country, the Broome County area does quite well as a whole. In 2000, the median income for the rest of the country was \$41,994. Broome County's median income was 7.5 percent higher than the average for the rest of the country, and the Town of Union was 9.9 percent higher than the rest of the country.

The City of Binghamton's median income increased by \$6,968 or 23.9 percent between 1990 and 2000, yet it fell further behind in terms of its income gap with the rest of the county. In 1990, Binghamton's median income of \$29,169 was 81.4 percent of the county's median income. But in 2000, the median income of \$36,137 was only 79.6 percent of the county's median income of \$45,422. As a comparison, the Town of Binghamton's median income for 2000 was less than the Town of Union's median income for 1990.

The Town of Union's median income rose from \$37,173 in 1990 to \$46,170 in 2000, an increase of 24.2 percent, which is slightly behind the overall County increase during the same time-period of 26.8 percent. The Town of Union, however, is ahead of the County's median income level, being 101.6 percent of the county average.

Table 20 ~ Income Distribution, Broome County and Selected Municipalities 1990-2000

| | | Broome | County | | | City of Bin | ghamton | | | Town of | Union | | | Town | of Vestal | |

| % of total | 10.9% | 12.6% | | | 19.1% | 22.2% | | | 8.7% | 10.9% | | | 6.7% | 7.5% | | |

Throughout Broome County, there has been a definite shift away from lower median incomes. Much of this has to do with inflation over the years and the raising of the state's minimum wage. There has also been a dramatic increase in some of the higher income brackets and the greatest decreases in the lowest incomes.

In the Town of Union, the number of households making over \$60,000 has increased by almost 54 percent between 1990 and 2000. Unfortunately there were some large losses in the lower middle income brackets. The number of households earning \$30,000 to \$34,999 decreased by 21 percent. The \$35,000 to \$39,999 range decreased 18.3 percent, and the \$40,000 to \$44,999 group decreased by 23.9 percent. These income ranges were the hardest hit by the loss of white-collar managerial and supervisory jobs in the area.

The other major factors accounting for changes in the income structure are the changes in the employment structure, increased reliance on professional occupations, and decreased reliance on operatives and other less skilled workers. Related to this change is increased female employment, especially at higher occupational levels, and the increased number of two income families. This second income, and usually a higher income than previously obtained, would substantially improve the family income without reflecting changes in the income of the primary wage earner.

Poverty

The poverty level in the census is defined by a formula that adjusts such factors as family size, sex of the family head, number of children under 18 years of age, and farm and non-farm residence. In Broome County, there were 10,216 families below the poverty level, 12.6 percent of the total families. 22.2 percent of the families in the City of Binghamton were below the poverty level. Those 4,691 families also accounted for 45.9 percent of the total families in Broome County living below the poverty level. Broome County's poverty level is comparable to the rest of the country, which was 12.1 in 2000. New York State had 14.2 percent of their residents living below the poverty line.

Town Comparisons

Table 21 ~ Income Distribution, Town of Union and Selected Municipalities

| | | Town (| Of Union | | | City of B | inghamton | | | Town | Of Vestal | |

11. POPULATION STUDY

The dynamics of population change is usually studied from two aspects: the spatial distribution and the demographic characteristics of the population. The spatial distribution of the population is represented by the urban/suburban movement of the population. The demographic characteristics are analyzed in terms of the sex, age, and racial structure of the population. The impact of economic change upon the population is particularly associated with the spatial distribution of the population.

A projection of the future population of the Town of Union is the basis on which the comprehensive plan has been developed. To make a meaningful assessment of the future population, it is important to analyze such factors as past population growth, its detailed characteristics and distribution, as well as to examine those factors, both regional and local, that are likely to influence the growth of the Town of Union. The population study includes both an analysis of these factors and alternative projections for the Town of Union.

The main source of information for this study was the United States Census publications for the Binghamton, New York Standard Metropolitan Statistical Area.

12. SPATIAL DISTRIBUTION OF POPULATION

Introduction

The present population of the Town of Union is the product of a complex interacting set of social and economic factors. The Town of Union's development started as an agricultural community and gradually attracted industrial growth. Transportation routes improved and provided an ideal setting for larger industrial corporations. The industrial growth has played a major role in determining population concentrations, particularly the recent out-migration from the villages of Johnson City and Endicott to the unincorporated portion of the town. The spatial distribution of the population reflects changes in the nature of the municipality, reflecting economic changes, housing development and changes in the interrelationships of the municipalities in the region and the region in the state and country. Past growth becomes an index of projected population growth in that the changes that occurred in the aforementioned areas can be directly related back to the effect seen in the population. The analysis of population distribution, then, acts as a control mechanism for projecting future population.

Regional Comparisons

As can be seen in Table 24, since the turn of the century, and up to the suburbanization process, which accelerated after World War II, the municipalities and the county enjoyed a high rate of growth. Over the sixty-year period from 1910 to 1970, the population of New York State doubled, from 9,113,600 in 1910, to 18,241,300 in 1970, since then the population of the state has hovered right around the 18 million mark. Broome County's population in 2000 (200,536) was nearly triple the 1910 population of 78,809. As shown in Table 22, the County's population peaked in 1970 with 221,815 residents.

The county's population, as a proportion of the state's population, has remained virtually unchanged from 1910, when it made up .9 percent of the state's population until 2000 when it made up 1.1 percent of the total population. Broome County reached its highest proportion of New State population in 1960 at 1.3 percent.

The Town of Union reached a high point of 30.3 percent of the county's population in 1940, and then again in 1960. Since then the Town of Union's population has diminished only slightly, as a percentage, when compared to the rest of Broome County. As would be expected the portions of the Town, Johnson City and Endicott, which are mainly in the urban areas of Union, peaked during the prime manufacturing years and have been receding as the Part-Town area still has room to expand. Much of the Endicott and Johnson City areas

were already as built up as they could be by 1950. After being completely built up, the only other place residents could find to live was in the Part-Town area, which has continued to increase its proportion of the Town of Union as a whole.

In 2000, the Town of Union was the largest municipality in the county, accounting for 28.1 percent of the county's population, compared to Binghamton's 23.6 percent share. The Town of Union had two periods of tremendous growth, between 1910 and 1930 and between 1950 and 1960. Between 1910 and 1920, the town's population increased from 9,486 to 25,651, an increase of 16,580 people or 170.4 percent. The growth occurred in the villages and was primarily due to the development of the Endicott-Johnson Company. The town jumped from 12.0 percent of the county's population in 1910 to 22.6 percent in 1920. This jump established the villages as urbanized areas. During the period between 1920 and 1930, the population of the town increased to 42,231, an increase of 16,580 people or 64.6 percent.

Table 24 ~ Population of New York State, Broome County and Selected Municipalities 1900-2000

| Census 2000 Municipality | 1900 | 1910 | 1920 | 1930 | 1940 | 1950 | 1960 | 1970 | 1980 | 1990 | 2000 |
|--------------------------------|--------|-----------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| New York State | NA | 9,113,600 | 10,385,200 | 12,588,100 | 13,479,100 | 14,830,200 | 16,782,300 | 18,241,300 | 17,558,000 | 17,990,455 | 18,976,457 |
| S.M.S.A | NA | NA | NA | NA | NA | 214,864 | 250,463 | 268,328 | 263,460 | 264,497 | 252,320 |
| Broome County | 69,140 | 78,809 | 113,610 | 147,022 | 165,749 | 184,698 | 212,661 | 221,815 | 213,648 | 212,160 | 200,536 |
| City of Binghamton | 39,647 | 48,443 | 66,800 | 76,662 | 78,309 | 80,674 | 75,941 | 64,123 | 55,860 | 53,008 | 47,380 |
| Town of Vestal | 1,850 | 1,618 | 1,910 | 2,848 | 5,710 | 8,902 | 16,806 | 26,909 | 27,238 | 26,733 | 26,535 |
| Town of Union | 5,707 | 9,486 | 25,651 | 42,231 | 50,195 | 55,676 | 64,423 | 64,490 | 61,179 | 59,786 | 56,298 |

The City of Binghamton accounted for 61.5 percent of the county's population in 1910. It has since declined dramatically, accounting for only 23.6 percent of the county's population in 2000.

The Town of Vestal has experienced tremendous growth since its 1910 population of 1,618 people. The growth was concentrated in the 1950s and 1960s. In 1950, the Town of Vestal's population was 8,902. It increased by 7,904 people or 88.8 percent to a 1960 population

of 16,806. The growth of population in the Town of Vestal is a result of the suburbanization of the northern portion of the town and the establishment of SUNY at Binghamton. Part of the growth of population is due to the inclusion of the college students into the population.

Table 25 ~ Proportion of Broome County's Population To New York State and Municipal Populations

| Census 2000 | 1910 | 1920 | 1930 | 1940 | 1950 | 1960 | 1970 | 1980 | 1990 | 2000 |
|------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Broome to N.Y.S. | 0.9% | 1.1% | 1.3% | 1.2% | 1.2% | 1.3% | 1.2% | 1.2% | 1.1% | 1.1% |
| Town of Union | 12.0% | 22.6% | 28.7% | 30.3% | 30.1% | 30.3% | 29.1% | 28.6% | 27.0% | 28.1% |
| Part-Town | 2.5% | 3.8% | 8.5% | 8.7% | 8.9% | 12.5% | 13.5% | 13.9% | 13.8% | 13.8% |
| Johnson City | 4.8% | 7.6% | 9.2% | 10.9% | 10.4% | 9.0% | 8.1% | 8.0% | 8.0% | 7.7% |
| Endicott | 5.0% | 11.3% | 11.0% | 10.7% | 10.9% | 8.8% | 7.5% | 6.8% | 6.4% | 6.5% |
| Vestal | 2.1% | 1.7% | 1.9% | 3.4% | 4.8% | 7.9% | 12.1% | 12.7% | 12.6% | 13.2% |

Table 25 illustrates that since 1930 the Town of Union has accounted for a large percentage of Broome County's population, and that share has fluctuated very little since, remaining between 28.1 and 30.3 percent. The increase in the Part-Town was due to the suburban growth of Binghamton and the two villages. The growth from 1930 to 1950 was more moderate, a gain of 7,964 or 18.9 percent during 1930 and 1940 and an increase of 5,481 or 10.9 percent during 1940 to 1950. The suburbanization process that accelerated after the Korean War was due to increased reliance on the automobile, the availability of federally insured and no down payment loans, and higher living standards. The town's population between 1950 and 1960 increased by 8,747 people or 15.7 percent, to 64,423 in 1960.

Part-Town/Village Comparisons

While the villages reached their peak populations in 1950, the Part-Town area has consistently expanded its population. The Part-Town area increased in population from 4,261 in 1920 to 27,730 in 2000, and now includes nearly half, 49.3 percent, of the town's population, as shown in Table 19.

The Part-Town area's two largest growth periods were the 1920 to 1930 and 1950 to 1960 decades. During 1920 to 1930, the Part-Town area's population increased by 8,172 people or 191.8 percent. During the 1920 to 1930 period, two factors were at play. The Part-Town was considered a desirable suburban area for Binghamton residents, a preference which fostered the growth of such areas as Westover

and Fairmont Park. Second, the Part-Town acted as a suburb to the two growing villages. Much of West Corners, West Endicott, North Endicott, and parts of the Endwell area developed during this period as suburban adjuncts to the villages, especially Endicott.

During the 1950s, the Part-Town area's population increased by 10,153 people or 62.0 percent, as shown in Table 19. In 1950, the Part-Town area accounted for only 29.4 percent of the town's population, the smallest of the three municipalities. In 1960, the Part-Town area increased to 41.2 percent of the town's population, versus Endicott's 29.1 percent and Johnson City's 29.7 percent. As reported in the economic base section of the report, these areas served previously as a bedroom community for Binghamton because most people still worked in Binghamton in 1960. The growth in the Part-Town was in direct contrast to the slight decrease in Johnson City's population, a decrease of 131 people, and a large decrease in Endicott's population, a loss of 1,275 people or 6.4 percent.

Between 1960 and 1970, the Part-Town area increased its population from 26,530 people in 1960 to 29,909 in 1970, an increase of 3,379 people or 12.7 percent. In comparison, the village of Johnson City, despite annexation from the Part-Town area, lost 1,093 people or 5.7 percent and the Village of Endicott lost 2,219 people or 11.8 percent. During this period, as in each one before, development moved further north in the town and previously economically unfeasible steep slopes located in the developed areas were developed. As discussed earlier, the orientation of the residents changed from working in Binghamton to working in the town. The expansion of IBM and its high paying professional employment allowed the people to move to the newer, higher cost housing being built in the above areas.

The population of the Part-Town area had been relatively stable losing only 538 people in the twenty years after 1970. However, the Part-Town area was greatly affected by the departure of IBM and their subsidiaries, losing 1,641 people, approximately 47 percent of all the losses in population for the entire Town of Union.

The populations of Johnson City and Endicott have declined since 1950 and now approximate the levels first reached during the 1930s. In Johnson City, the population declined from a 1950 high of 19,249 to 18,025 in 1970 and in Endicott from a 1950 high of 20,050 to only 10,556 in 1970. The decline of Endicott and Johnson City as areas of employment and the increasing suburban development in the Part-Town caused much of the out-migration of people. Endicott has little vacant land available for new residential development, therefore, precluding new single-family construction in the village. Johnson City has annexed vacant land and could have residential expansion, but the higher taxes in the villages make the Part-Town more competitive and desirable for new residential development.

Johnson City accounted for a loss of 1,354 people between 1990 and 2000, almost 40 percent of the population lost in the Town of Union. Johnson City was also particularly hard hit due not only to the losses of jobs in Endicott because of the departure of IBM, but also because it sits between Endicott and Binghamton, which also saw a decline in business opportunities over the same time period.

The increase of persons residing in the Part-Town area of the Town of Union may be attributed to several major factors. From the late 1950s to the present, the Part-Town area of the Town of Union has been the setting for the creation of major single-family subdivisions and several moderately sized multiple-family developments. With limited areas for new residential development in the villages, most of the new construction has taken place in the Part-Town area.

Table 26 ~ Town of Union Population 1920-2000

| Census 2000 Municipality | 1920 | 1930 | 1940 | 1950 | 1960 | 1970 | 1980 | 1990 | 2000 |
|--------------------------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Town of Union | 25,651 | 42,231 | 50,195 | 55,676 | 64,423 | 64,490 | 61,179 | 59,786 | 56,298 |
| Part-Town | 4,261 | 12,433 | 14,454 | 16,377 | 26,530 | 29,909 | 29,596 | 28,371 | 25,973 |
| Endicott | 12,803 | 16,231 | 17,702 | 20,050 | 18,775 | 16,556 | 14,457 | 14,031 | 13,922 |
| Johnson City | 8,587 | 13,567 | 18,039 | 19,249 | 19,118 | 18,025 | 17,126 | 17,384 | 16,403 |

The migration from the two villages to the Part-Town area can also be related to easy accessibility of shopping centers, grocery stores, and convenience stores. Due to the growth of residential neighborhoods, small shopping centers and businesses have located near these residential developments offering prospective Part-Town residents with convenience to shopping and also a more suburban atmosphere.

Migration

The figures from the 2000 Census indicate whether a person's place of residence in 2000 was the same as it had been in 1995, or whether he or she lived in a different house in the same county, a different house in the same state, a different house in a different state, or he or she had lived in a different country altogether in 1995.

The figures in Table 27 reveal which neighborhoods are composed of people that are well settled and have established ties to their community as well as which ones have a steady turnover in their populations indicating transient populations resulting in instability in the neighborhood.

Neighborhoods like North Endwell/Union Center, West Corners, West Endicott, North Endicott, Northside East Endicott, Central Endwell, North Endwell West, North Endwell East, Fairmont Park, Northside Johnson City, and Choconut Center all have high, more than 60 percent, rates of owner occupancy. The majority of the population has been in the same house for a number of years. Most of the dwellings in these areas are single-family homes, not apartment buildings, which directly affects the length of residency for most families.

The neighborhoods of Roundtop, Northside West Endicott, Riverhurst, South Endwell, Oakdale/Reynolds, Westover, and Southside Johnson City have medium levels of residency, between 50 and 60 percent. These neighborhoods have a mix of single-family residential and newer, garden apartment style multi-family housing complexes.

The neighborhoods of Airport Heights, Union District, Central Endicott West, Central Endicott East, Southside/Riverside, Floral Park, and Central Johnson City have low levels of owner occupancy, below 50 percent. These tend to be older neighborhoods, which have been converted from single family to multi family homes; as such, these neighborhoods have the lowest percentage of single-family homes.

Many of these same neighborhoods appear to be gateways for people coming to the area from different countries. The older housing stock, which typically command lower rent prices, give people opportunities to find a place to live.

Table 27 ~ Migration, Town of Union Neighborhoods, 1990-2000

| Census 2000 | Same | House | | nt House County | | rent House me State | | rent House erent State | | rent House ent Country | TOTALS |

13. AGE AND SEX DISTRIBUTION

Introduction

One of the most important aspects of planning a community's future needs is a detailed study of the age-sex distribution of the population. The age-sex structure serves as an index of the economic prospects of the community since the number of people in the working age groups constitutes the available labor pool. The age-sex distribution is also an important indicator of the amount and the type of community facilities that will likely be required in the future. For the purpose of this report, the following age groupings are used:

- **0-4** years old: This group determines the future educational and recreational needs.
- **5-14** years old: This group is the school age population and also has a strong relationship to recreational and educational needs.
- 15-24 years old: This group is generally considered to be the young labor force. This age group is the most mobile.

25-44 years old: This group is the primary working force. This age group is responsible for the increases and decreases of population, and the most indicative of a community's well-being.

45-64 years old: The 45-64 year old group is the most stable and settled. The labor force in this age group is usually at its height of earning power.

65+ years old: This group consists mostly of retired people who live on fixed incomes and who cannot usually afford major tax increases for community capital improvements.

County-Region Comparisons

When looking at the percentages of population by age and sex, the Towns of Union and Vestal as well as the City of Binghamton are very similar to Broome County as a whole. These three municipalities make up over 60 percent of Broome County's total population, so their influence will be significant.

In looking at Table 29, a number of issues are readily apparent. The first is the higher than average number of 15 to 24 year olds that live in Binghamton. This age group makes up 16.9 percent of the population of the city, 4 percent above the Broome County average; whereas, the Town of Union and Vestal both have populations of this age that are below the county average. Vestal, however, has their highest percentage of residents in the 45 to 64 years of age bracket, where earnings tend to be at their maximum. Finally, the Town of Union has the highest percentage of residents over the age of 65, at 17.7 percent.

When compared against the national average the real picture emerges. The percentage of the population, which is under 5 years of age is 6.8 percent for the rest of the country. The average for this age group in Broome County is only 5.9 percent. Binghamton, the Town of Union, and Vestal are all very close to the Broome County average, within .5 percent.

The national average for 5 to 14 year olds is 14.6 percent. Again, Broome County as a whole is below the average for the number of residents in this age group, at only 14 percent. The Town of Union and City of Binghamton are even further behind the national average at 12.6 and 12.4 percent respectively.

15 to 24 year olds make up 13.9 percent of the population of the United States. Except for Binghamton, which has 16.9 percent of its population in this range, the rest of Broome County is below the national average. The Town of Union's 15 to 24 year olds make up only 12.1 percent of the population while the Town of Vestal has an even lower 11.4 percent.

The age group of 25 to 44 year olds is 30.2 percent of the total population of the country. The Broome County average is only 27.7 percent. In the City of Binghamton 26.7 percent fall in this age range and the towns of Union and Vestal, 28.9 and 25.8 percent respectively, are both below the national average.

The 45 to 64 year old age group includes 22.0 percent of the population of the United States. Broome County is slightly ahead of the average here with 23.6 percent of their population in this age bracket. Binghamton is slightly below the national average at 21 percent, while the Town of Union is slightly ahead of it at 22.7 percent. Vestal leads the municipalities in Broome County with 26.2 percent of their population in this age range.

Concerning the population aged 65 or older, the average for the entire United States is 12.4 percent. Table 24 illustrates that Broome County is well above that average at 15.9, and that the Towns of Union and Vestal and the City of Binghamton are even higher than the Broome County average, at 17.7, 16.9 and 16.7 percent.

After reviewing the information concerning the population structure of Broome County and the Towns of Union and Vestal, as well as the City for Binghamton, it is apparent that the City and the Towns have a great deal of influence on the overall structure and age makeup of Broome County. As such, Broome County sits below the national average for people younger than 44 years old, and above the national average for people aged 45 and older and aged 65 and over.

While it might seem beneficial that Broome County tends to have higher than average number of 45 to 64 years, people who are supposed to be in their prime earning years, that assumption is only valid if there is a stable economy that has many long time employers where people in this age group would have been able to work for a number of years to accrue salary, benefits, and other perks. However, with the loss of many long term well paying industries, many of the people in this age bracket have probably undergone some recent job changes and have had to find employment with other firms and to start accruing benefits with that new employer.

| Town of Vestal | 5,375 | 25.8% | 12.5% | 13.3% | 5,477 | 26.2% | 12.6% | 13.6% | 3,536 | 16.9% | 7.5% | 9.4% |

Town - Village Comparisons

The Town of Union had 56,298 people living in it in 2000, and 25,973, or 46.1 percent of the population, of those lived in the Part-Town area. The Village of Endicott was home to 13,922 people, or 24.7 percent, and 16,403, or 29.1 percent lived in the Village of Johnson City.

By looking at Table 30 we can see that the distribution of the population under 5 years of age was almost directly equivalent to the distribution of people in the various municipalities. The Part-Town area accounted for 46.1 percent of the total population of residents under 5 years of age. The Village of Endicott, on the other hand, accounted for only 24.7 percent of the total population of the Town of Union, while it accounted for a slightly higher, 24.9 percent, of the total population of residents under 5 years old. Endicott has a higher proportion of residents under 5 years old, when compared to their overall population. The Village of Johnson City has a slightly below average percentage of the population of residents under 5 years old, 29.0 compared to their proportion of the town, which was 29.1 percent.

When looking at the age group of people 5 to 14 years old, the Part-Town area has 46.1 percent of the population of the town, but 50.3 percent of its population aged 5 to 14. The Village of Endicott, while having 24.7 percent of the population has only 24.1 percent of the 5 to 14 year old group, slightly below average. The Village of Johnson City, which has 29.1 percent of the residents, accounts for only 25.5 percent of the 5 to 14 year old age bracket.

The Part-Town area accounts for 46.1 percent of the people living in the Town of Union, however, only 39.9 percent of the people aged 15 to 24 reside there. The Village of Endicott accounts for 24.7 percent of the Town of Union's population, yet 25.2 percent of them are aged 15 to 24, showing a slightly above average concentration of this age group in Endicott. The Village of Johnson City accounts for 34.9 percent of this age group, while they make up only 29.1 percent of the overall population, showing that a large number of 15 to 24 year olds live in this area. This could be due to the fact that a significant portion of the housing in the Johnson City area is used for students from Binghamton University, resulting in higher than average concentrations of people in this age group in this area.

The population group aged 25 to 44 is very comparable to the overall area population percentages. The Part-Town area accounts for 46.1 percent of the total population and 45.9 percent of people aged 25 to 44. The Village of Endicott makes up 24.7 percent of the population of the Town of Union and has 24.7 percent of the residents aged 25 to 44. The Village includes 29.1 percent of the Town of Union and has 28 percent of the 25 to 44 year old residents living there.

The Part-Town area has a slightly higher rate of residents aged 45 to 64 years, 51.6 percent, compared to their overall average of 46.1 percent of the Town of Union's total population. Both Endicott and Johnson City have lower rates of residents in this age group; with 22 and 26.4 percent compared to 24.7 and 29.1 percent of Union's total population.

The population of the Part-Town area aged 65 or greater, 41.2 percent, was well below the overall percentage of the town population of 46.1 percent. On average, there are 4.9 percent fewer people aged 65 or more living in the Part-Town area. Slightly more than 24 percent of residents aged 65 or above live in the Village of Endicott, which is close to the respective town percentage of 24.7 percent. Johnson City shows an above average number of 65+ residents with 32.8 percent of the population of 65 and older, while they account for only 29.1 percent of the total Town of Union's population.

Overall, the Part-Town area accounted for above average numbers of 5 to 14 year olds, and 45 to 64 year olds, and below average number of residents aged 15 to 24 and over 65 years old.

The Village of Endicott had above average numbers of people 65 years and over, and below average numbers of people 45 to 64 years old.

The Village of Johnson City had lower than average populations of 5 to 14 year olds, as well as 45 to 64 year olds, but had higher than average numbers of residents aged 15 to 24 and over 65 years old.

There are a number of factors that skew this distribution such as large concentrations of similar age groups as at Binghamton University, the age and cost of housing, and the concentration of senior citizen housing.

Table 30 ~ Percentage of Population, By Age, And Municipality

| Census 2000 | Under | 5 years | 5 to 14 | l years | 15 to 24 years | | | | |

Neighborhood Comparison

When looking at the neighborhoods it is easy to talk in terms of housing age: which housing stock is the youngest, where the older houses are built, where housing is worth more or less in the town. Comparing the age of the population living in the neighborhoods is much more complex and much more variable due to the mobility of people compared to housing stock. Simply stated, people move; houses do not.

Table 31 shows that the neighborhood of Oakdale/Reynolds has one of the highest percentages of residents under 5 years old and people aged 14 to 24. It also has one of the smallest percentages of people aged 45 to 64 and over 65 years old. This is due in part to the large number of garden apartment style multi-family complexes along Reynolds Road such as the Indian Ridge and Mountain View Apartments. These apartments are prime living space for young people looking to start families, but who do not yet have the money for a house. Much of the housing built in this area is also relatively new, with 35.8 percent built post 1980. The higher cost of newer housing has prevented older residents from moving into this area.

The neighborhood of Central Endicott East also has some of the highest percentages of populations of 15 to 24 year olds, 25 to 44 year olds, as well as those younger than 5 years old. This neighborhood is composed of mostly commercial and industrial properties, but also has a good number of single and multi-family homes. Most of the houses in this area are older and located near industrial sites, making affordable housing for families just starting out, but not precluding older residents.

South Endwell ranks among the neighborhoods with the highest percentages of residents under 5 years old, 15 to 24, and 25 to 44 years old, as well as having some of the lowest percentages of people aged 45 to 64 and over 65 years old. Much of this neighborhood contains commercial buildings as well as single and multi-family housing. A good number of apartment complexes and older affordable houses are situated in this neighborhood, which contributes to the high number of residents under 45 years old. Nothing seems to exclude older residents even though this neighborhood has one of the lowest parentages of people aged 45 to 64 and those over 65 years old.

North Endwell West, on the other hand, has the highest percentage of population over 65 years old, as well as a relatively high percentage of residents aged 45-64. This neighborhood also has the accounts for some of the lowest percentage of populations aged 25 to 44 years, 15 to 24 years, 5 to 14 years, and under 5 years old. This neighborhood mainly makes up the area behind Highland Park. Many of these houses were built between 1950 and 1979. A good number of the houses here are still occupied by the original owners, who have seen their children grow up and move out of the neighborhood. A senior living center, Marian Apartments, is located in this neighborhood as well, adding to the already high percentage of people over 65.

The neighborhoods of North Endwell/Union Center, West Corners, Central Endicott West, South Endwell, Central Endwell, Fairmont Park, and Oakdale/Reynolds, all have high percentages, over 20 percent, of residents under 15 years old. These neighborhoods are attractive to

younger families due to lower housing costs, and availability of apartments due in part to the age of the housing structures in the neighborhood. As housing units age, particularly in the older urbanized parts of the town, they are sometimes converted from single-family to two-family and multi-family homes.

Strangely, there seems to be a big difference between where the people aged 25 to 44 live compared to where people aged 45 to 64 live. In fact they seem to be almost completely opposite to each other. The neighborhoods with the higher percentages of people 25 to 44 years old have the lower percentages of people 45 to 64, while the neighborhoods that have higher percentages of 45 to 64 year olds have lower percentages of those aged 25 to 44. Only four of the twenty-five neighborhoods are the exception to this; North Endwell/Union Center, which has a relatively high percentage of both age groups, and Roundtop, Southside/Riverview, and Oakdale Reynolds which have low percentages of each age group.

14. RACIAL COMPOSITION

Introduction

The figures on racial composition and the definitions of the categories have changed a great deal from the time prior to the 2000 Census. The 1980 and 1990 Census recognized only four different racial categories; White, Black, Indian, and Asian or Pacific Islander. The 1960 and 1970 Census data was even less definite, recognizing only three categories, White, Black, and Other. For the 2000 Census over 50 different categories exist for classifying race, as many more people, because of mixed ancestry, no longer fit neatly into the three or four previous designations. For ease of reading and constraints of space, only the top seven racial classifications from the 2000 Census: White alone, Black or African American alone, American Indian or Alaskan Native alone, Asian alone, Native Hawaiian or Pacific Islander alone, some other race alone, and two or more races, have been included.

Regional Comparison

As shown in Table 32, Broome County had a very small proportion of non-white population, accounting for less than 9 percent of the population in 2000, however this portion of non-white only residents is growing more rapidly now than ever before. Between the years of 1969 and 1979, there was an increase of only 2.9 percent of non-white population in the Broome County area. Between 1990 and 2000, there was an increase of 4.4 percent of non-white only residents. A large portion of that growth has been in the Asian community. There has been nearly a 52 percent growth in population in the Asian classification in Broome County over the last ten years. The Town of Vestal has seen an increase of almost 84 percent in the number of people of Asian descent since 1990, while the Town of Union's Asian population has increased over 37 percent in the same time. Binghamton has seen an increase of over 45 percent for the same population over the same period of time.

Town-Village Comparison

As discussed in the above section, the proportion of white population in the two villages and in the Part-Town area declined between 1990 and 2000, as shown in Table 31. Relative to the number of residents present in 1990, there were large increases in the number of non-white residents between 1990 and 2000 in the Part-Town and Endicott section of Union. The number of non-white residents has doubled and tripled in some cases, and has grown up to five fold in other cases. Even though these are large increases relative to the number that was present in 1990, the largest single factor in the decreasing percentage of white only population between 1990 and 2000 is the loss of white only residents from the municipalities.

In 1990 there were 13,068 white only residents in the Endicott area, and in 2000 there were 11,949, indicating a loss of 1,119 people. At the same time, the non-white population grew by only 518 people. In Johnson City, there were 16,097 white only residents in 1990 compared with 13,801, in 2000, signaling a loss of 2,296 people, while the village gained only 792 non-white residents.

Neighborhood Comparison

All of the neighborhoods in the Town of Union are predominantly white. They range from 78.5 percent to 96.8 percent white. From looking at Table 33, some trends in minority residential patterns can be seen. If we look for neighborhoods that have the highest concentrations of Black or African American, Asian, or two or more races we find Central Endicott West, Central Endicott East, Southside/Riverview, Floral Park, and Central Johnson City. These neighborhoods also happen to have the highest proportions of housing stock built before 1939 and the highest number of residents that have no High School diploma.

15. EDUCATIONAL ATTAINMENT

Introduction

There is a distinct link between the level of educational attainment, family income, and the economic and employment characteristics of a community. Municipalities with a high level of educational attainment generally have a high level of family income, lower unemployment rates, and normally have a favorable rate of economic growth. In municipalities with a low level of educational attainment, the reverse is true. This chapter presents an analysis of the level of educational attainment for the residents of the Town of Union and surrounding municipalities. This chapter also includes an analysis of the current student enrollment in the Part-Town area.

County-Region Comparison

As seen in Table 34, Broome County is quite comparable to the rest of New York State concerning education. The table provides an idea of the level of education currently achieved in Broome County. Many residents of Broome County have only a high school diploma, 32.7 percent, which is above the New York State average. The number of residents that have Associate's degrees is also above the state average. Bachelor's, Master's, and Doctoral degrees all fall below the New York State average. It is apparent that, on average, Broome County residents generally achieved a lower level of education than the rest of the state.

The City of Binghamton falls below the Brome County average in all categories except the percentage of residents that have no diploma at all and the percentage that have doctoral degrees, both of which are above average. It is assumed that many of the professors of Broome Community College, as well as Binghamton University, live within the City of Binghamton.

The Town of Union is similar to Broome County in that it has a lower proportion of residents that never graduated from high school and a high proportion who are high school graduates only. The Town of Union boasts an above average number of Associate's degrees and a higher percentage of Bachelor's and Master's degrees than the county average, but falls short of the state average for Bachelor's, Master's, and Doctoral degrees, indicating that the most frequent educational attainment appears to be the high school diploma or an Associate's degree.

The Town of Vestal has the lowest percentage of residents with no High School diploma. They are also the lowest in the area with residents that graduated only from High School, and have higher than average proportions of their residents having an Associate's,

Bachelor's, Master's, or Doctoral degree. The presence of Binghamton University is a large factor in the unusually high proportion of Bachelor's, Master's, and Doctoral degrees in the Vestal area. Many people who have already earned their Bachelor's degree may still be living in the Vestal area, working on their Master's degree, the same can be said of Master's students working on their Doctoral degrees. The high percentage of residents with Doctoral degrees is a direct result of Binghamton University's being located in Vestal, quite close to a large residential section of the town.

As the population ages, older people with less education become a smaller proportion of the population. The completion of high school, at least, has become a mandatory requirement for most jobs that were previously filled by people with lower educational levels. As the major employers expand their need for highly trained personnel and jobs requiring fewer skills jobs contract, the educational attainment level should continue to increase. The increase will not be as rapid as in the previous decades since the proportion of people having a post high school education will not increase as rapidly as the proportion of people with a high school education. It stands to reason then that an area with a higher number of older residents would also have a higher than average proportion of residents with below average education.

Neighborhood Comparison

As expected, the neighborhoods with the highest percentage of residents with no high school diploma are also the neighborhoods with the lowest percentage of residents with either a Bachelor's or a Master's degree, and vice versa. Neighborhoods with high proportions of people with no high school diploma include West Corners, Roundtop, West Endicott, Central West Endicott, Central Endicott East, Floral Park, Central Johnson City, and Northside Johnson City.

Neighborhoods with high percentages of residents with a Bachelor's or Master's degrees include; North Endwell, Airport Heights, Central Endwell, North Endwell West, North Endwell East, Fairmont, Oakdale/Reynolds, and Northside Johnson City.

There are also a few neighborhoods that could be considered neither of the above. Choconut and North Endicott have higher than average numbers of residents with Associate's degrees, but not Master's or Bachelor's degrees, and have a small number of residents that have no high school diploma.

16. POPULATION PROJECTIONS

Introduction

Preceding sections of the Population study have analyzed historical and existing characteristics of the Broome County area and the Town of Union. Population projections are a useful tool when determining future educational and community needs.

Due to the present economic and employment situation, it is extremely difficult to make accurate population projections. As the projections extend further in time, the accuracy of these projections may also diminish.

Regional Projection

Table 35 illustrates the population projections for Broome County and selected municipalities as produced by the Southern Tier East Regional Planning and Development Board.

Town of Union Projections

The projections are based on the trend that older areas of the county such as the City of Binghamton and the Villages of Endicott and Johnson City will continue to decline while suburban communities such as the towns of Vestal, Binghamton, and Maine will continue to grow more rapidly.

A basic-assumption is that employment will remain relatively stable, since the largest employers project little to no expansion. Much of the new residential development, therefore, will be reflecting shifts in areas of residence from the City of Binghamton and the villages to the unincorporated area of the town.

Table 35 ~ Broome County Population Projections Through The Year 2030
